### INTERNAL LEAKAGE (TYPICAL)

Do not operate pump more than 5 seconds at any speed or viscosity if internal leakage is more than 50% of theoretical flow. Total leakage is the sum of each section loss at its operating conditions.

### NOISE LEVEL (TYPICAL)

Double pump noise level is given with each section discharging at the pressure noted on the curve.

### HYDROMECHANICAL POWER LOSS (TYPICAL)

Total hydrodynamic power loss is the sum of each section at its operating conditions.

### PERMISSIBLE RADIAL LOAD

#### Shaft code X

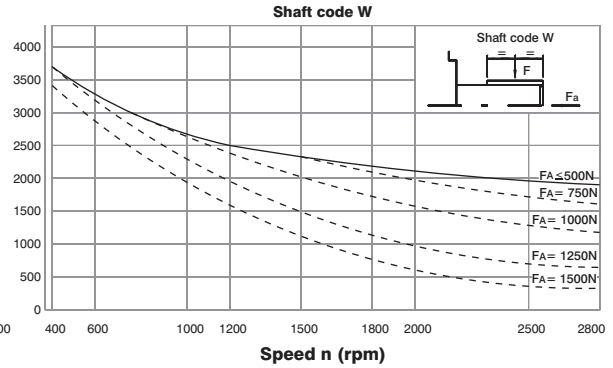

Speed n (rpm)

## PERMISSIBLE RADIAL LOAD

## PERMISSIBLE RADIAL LOAD

These curves permit to simultaneously check the maximum permissible radial and axial load on the shaft involved. Those load value are determined for 10000 hours bearing lifetime at operating under  $F_a$  and  $F$  given. To get information for a different lifetime the radial load corrected is.

If  $F_a$  is smaller than minimum axial force on the curves then

$$\text{Correct } F = \frac{F \text{ curve}}{\left(\frac{LH \text{ Required}}{10000}\right)^{\frac{1}{3.33}}} \quad LH = \text{Lifetime in hours}$$

If  $F_a$  is higher than minimum axial force then  $F$  radial load is :

$$\text{Correct } F = \frac{F \text{ curve}}{\left(\frac{LH \text{ Required}}{10000}\right)^{\frac{1}{3}}}$$
